                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    * NOTE: This is a 'working draft' sequence. It currently consists of 47 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed.
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Desc: iption

The present invention relates to a method for determining gene structure when the genomic sequence is unknown. The method involves sequencing the gene across soon intron boundaries using evenly spaced primers or tiled primers. The tiled primers comprises nucleic acids that hybridise to the known cDNA sequence of the gene at about 100-300 base intervals and the gene comprises the template. Gene structure can be determined without the need to sequence the entire gene. The method provides information necessary to determine gene structure and phenotypic expression without the need to sequence entire chromosomal copy of the gene or fragment. The methods are useful in germline sequence variation analysis. The method is also useful for determining the boundaries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining structure of genes whose sequence is not known from cDNA, by sequencing the gene or gene across exon-intron boundaries using evenly spaced primers comprising nucleic acids that hybridize to the cDNA of gene

between regions of nucleic acids that were separated by intervening sequence, and also for determining boundaries present in genes containing group 1 type intruors such as Tetrahymena TRNA, where self-splicing occurs in the presence of guanosine cofactor. The present sequence is human cytochrome P450 (CYP450) 2C19 gene related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1510 ccttttcnag-tctcaaaaatctatggccctgtgttcactctgtattttggcctggaacg 1568

biallelic markers. The sequences are related to various human genes incrosomal glutathione S-transferase II (MGSZII), malate decarboxylase enzyme (DMEI/MEI), cytochrome P450, glutathione genes including microsomal glutathione S-transferase II (MGSZII), malate decarboxylase enzyme (DMEI/MEI), flavin-containing monoxygenases (FMO), gamma-glutamyltransferase S (GGTS), dipeptidase (DP), glucose G-phosphate dehydrogenase (GFDH), phosphogluconate dehydrogenase (FMO), gluconase (GFDH), phosphogluconate dehydrogenase (FMO), alphosphate glucoronosyl transferases (UGT2). Each of these sequences contains a biallelic marker/polymorphism, which is represented in the sequence as a degenerate/undefined base. The genes to which the biallelic marker containing sequences are related are involved in drug metabolism. Sequences AAAHS1594 - AAAHS1598 represent the genomic sequence. AAB62205-AAB6206 are MGSTII gene and four alternative MGSTII cDNA sequences. AAB62205-AAB6206 are MGSTII gene products. PCR primers AAHS1599 and AAAHS1600 are used in an example for the amplification of human genomic DNA fragments. The invention includes a method of genotyping comprising determining the invention of an allele of a DME- or MGSTII related biallelic marker in population of an allele of a DME- or MGSTII related biallelic marker and phenotype, and to detect association between hablotype and phenotype and phenotype and to detect association between allele.
                                                           Human; biallelic marker; single nucleotide polymorphism: SNP; MGSIII: marcosomal glutathione S-transferase II; malate decarboxylase enzyme: DMEI; WEI; cytochrome P450; glutathione reductase; GSHR: GSHS; GGIS; flavin-containing monooxygenase; FMO; gamma-glutamyltransferase 5: flavin-containing monooxygenase; FMO; gamma-glutamyltransferase 5: phosphagaluconate dehydrogenase; GSPDH: haplotype: phosphogluconate dehydrogenase; PGDH: drug metabolism: phenotype: uridine diphosphate glucoronosyl transferase; UGIZ; asthma; hepatoxicity;
                   Human CYP2C8 related DNA containing a biallelic polymorphism SEQ ID 49
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or allele specific amplification assays. The method can be used to determine whether an individual suffers or is at risk of developing asthma or is at risk of developing hepatoxicity on treatment with

                                                                                                                                                                                                                                                                        Sequences AAH51110-AAH51593 represent human DNA fragments which contain biallelic markers. The sequences are related to various human genes including microsomal glutathione S-transferase II (MGSIII), malate decarboxylase enzyme (DMEJ/MEI), cytochrome P450, glutathicne reductase/synthase (GSHR/GSHS), flavin-containing monooxygenases (FMO), gamma-glutamyltransferase 5 (GGTS), dippeptidase (DPH), and uridine dehydrogenase (G6PH), phosphogluconate dehydrogenase (PCDH). and uridine dehydrogenase (G6PH), phosphogluconate dehydrogenase (PCDH). and uridine dehydrogenase (G6PH), phosphogluconate dehydrogenase (PCDH). and uridine contains a biallelic marker/DOlymorphism, which is represented in the sequence as a degenerate/undefined base. The genes to which the biallelic marker containing sequences are related are involved in drum metabolism. Sequence AAH51594 and AAH51599 and AAH51590 and AAH51590 and example for the amplification of human genomic DNA fragments. The invention includes a method of genotyphing comprising determining the invention includes a method of genotyphing comprising determining the identity of a nucleotide at a DME- or MGSTII related biallelic marker in population of an allele of a DME- or MGSTII related biallelic marker in conjudical sample. The method is used to determine the frequency in population of an allele of a DME- or MGSTII related biallelic marker and treatment. The method is also used to determine applicate and phenotype, and to detect association between haplotype and phenotype or allele specific amplification assays, sequencing assays or allele specific amplification assays. The method developing etchning at the atthem or is at risk of developing at the atthm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3.

cc reductase/synthase (GSHR/GSHS), flavin-containing monooxyge:ases (FWO), gamma-glutamyltransferase 5 (GGT5), dipeptidase (DP), glucose 6-phosphate dehydrogenase (GGPDH), phosphate dehydrogenase (FOBH), and uridine diphosphate glucoronosyl transferases (UGT2). Each of these sequences contains a biallelic marker/polymorphism, which is represented in the sequences as degenerate/undefined base. The genes to which the biallelic marker containing sequences are related are involved in drug metabolism. Sequences AAHSIS94 - AAHSIS98 represent the genomic sequence of the marker containing sequences are related are involved in drug metabolism. Sequences AAHSIS94 - AAHSIS98 represent the genomic sequence of the marker containing sequences. PCR primers AAHSIS99 and AAHSIS00-SAABSS906 are WGSTII gene and four alternative MGSTII cDNA sequences. AABSS906 are was method of genotyping comprising determining the invention includes a method of genotyping comprising determining the invention includes a method of genotyping comprising determining the constitution of an allele of a DME- or MGSTII related biallelic marker and population of an allele of a DME- or MGSTII related biallelic marker and considered and phenotype, and to detect association between haplotype and phenotype. The method is also used to detect association between haplotype and phenotype. The polyunclectides are used, in hybridization assays, sequencing assays or allele specific amplification assays. The method can be sed to asthma or is at risk of developing hepatoxicity on treatment with

Human cytochrome P450 (CYP450) 2C19 gene PCR product #3.

رب ا

```
The present invention relates to a method for determining gene structure when the genomic sequence is unknown. The method involves structure when the gene across exon-intron boundaries using evenly spaced primers or tiled primers. The tiled primers comprises nucleic acids that principle to the known CDNA sequence of the gene at about 100-300 base intervals and the gene comprises the template. Gene structure can be certained without the need to sequence the entire gene. The method provides information necessary to determine gene structure and phenotypic expression without the need to sequence entire chromosomal copy of the canalysis. The methods are useful in germline sequence variation between regions of nucleic acids that were separated by intervening capence, and also for determining boundaries present in genes containing croup 1 type introns such as Tetrahymena rRNA, where self-splicing occurs in the presence of guanosine cofactor. The present sequence is a PCR product obtained from human cytochrome P450 (CYP450) 2C19 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining structure of genes whose sequence is not known from cDNA. by sequencing the gene or gene across exon-intron boundaries using evenly spaced primers comprising nucleic acids that hybridize to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to a method for determining gene structure when the genomic sequence is unknown. The method involves sequencing the gene across exon-intron boundaries using everly spaced primers or tiled primers. The tiled primers comprises nucleic acids that hybridise to the known cDNA sequence of the gene at about 10.300 base intervals and the gene comprises the template. Gene structure can be determined without the need to sequence the entire gene. The method provides information necessary to determine gene structure and phenotypic expression without the need to sequence entire chromosomal copy of the gene or fragment. The methods are useful in germline sequence avaiation analysis. The method is also useful for determining the boundaries between regions of nucleic acids that were separated by intervening sequence, and also for determining boundaries present in genes containing group 1 type introns such as Tetrahymena rRNA, where self-splicing occurs in the presence of gunnosine ocfactor. The present sequence is a PCR product obtained from human cyclochrome P450 (CYP450) 2019 gene

sequencing the genomic sequence is unknown. The method involves sequencing the gene across exon-intron boundaries using evenly spaced primers or tiled primers. The tiled primers comprises nucleic acids that hybridise to the known cDNA sequence of the gene at about 100-300 base intervals and the gene comprises the template. Gene structure can be intervals and the gene comprises the template. Gene structure can be provides information necessary to determine gene structure and phenotypic expression without the need to sequence entire chromosomal copy of the gene or fragment. The methods are useful in germline sequence variation analysis. The method is also useful for determining the boundaries between regions of nucleic acids that were separated by intervening sequence, and also for determining boundaries present in genes containing in the presence of guanosine cofactor. The present sequence is a PCR product obtained from human cytochrome P450 (CYP450) 2019 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and 367U primer related to the invention.

```
This invention describes a recombinant cytochrome P450 protein which is purified from a host cell culture using a combination of detergents and enzyme inhibitors. The method comprises (a) fractionating the host cells to prepare their membranes, (b) adding a non-ionic detergent to the membranes in a concentration of 0.8% to 2% (w/v) in a detergent:protein ratio of between 4:1 to 10:1, (c) adding an ionic detergent:protein ratio of between 4:1 to 10:1, (c) adding an ionic detergent:protein ratio of between 2:1 to 4:1 (d) centrifuging the membrane-detergent ratio of between 2:1 to 4:1 (d) centrifuging the membrane-detergent ratio of between 2:1 to 4:1 (d) centrifuging the membrane-detergent ratio of between 2:1 to 4:1 (d) centrifuging the protein ratio of between 2:1 to 4:1 (d) centrifuging the contribution of the protein through a diethylaminocathyl-beaded column, then through a carboxymethyl-beaded column, and finally through a hydroxylapatite column. The method is used to purify cytochrome P450 proteins which are responsible for catalysing the oxidation of drugs, steroids, carcinogens and pesticides. The method simplifies the purification of P450 proteins, by the use of improved expression vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   126 cetageteteaaaggtetatggeeetgtgtteaetetgtattttggeetgaaacecatag 185

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..
                                                                  The nucleotide sequence of the cDNA encoding the human cytochrome F450 was amplified by PCR using the prient of 491 amino acids. The CDNA was amplified by PCR using the prients AA087735. The product was cloned into the yeast expression vectors pAAHSN or pAHRR to produce the vectors p2C9 for the expression of the cytochrome P450 alone or p2C9R for co-expression with the yeast NADPH*P450 reductase.

The vectors are used in a method for evaluating the safety of a chemical roompound by reacting the chemical compound with recombinantly produced human cytochrome P450 molecular species 1A2 (AA087714), 2C9, 2E1 (AA087716) or 3A4 (AA087710), or their auxillary species and variants (AA087716) or 3A4 (AA087717), or their auxillary species and variants or in cell extracts, and analysing the resulting metabolite to assess the safety of the chemical compound. The method is useful for determining whether the chemical compound, or its metabolite, will be converted into metabolite.

This is the nucleotide sequence of the human cytochrome P450 molecular species 2C9 gene which encodes a protein of 490 amino acids. The gene was amplified from a human liver derived cDNA library as 2 fragments of 0.9 and 0.6 kb using primers AA128915-8. The prod. was cloned into the yeast expression vector pAA45N to generate plasmid p2C9 for prodn. of the cytochrome only or into the vector pAA45N to generate plasmid p2C9 for prodn. of the cytochrome only or into the vector pAA45N to generate the plasmid p2C9 for co-prodn. with the yeast NAD9H-P450 reductase. The sequence is placed under control of the yeast ADH gene promoter and terminator. The vectors are used in a method for evaluating the safety of a cpd. by reacting the test cpd. with recombinantly produced human cytochrome P450 mol. species 1A2 (AA128880), 2C9, 2E1 (AA128832), 3A4 (AA128833) or their variants (AA128880), 2C9, 2E1 (AA128382), 3A4 (AA128383) or eductase (either as a fused protein or as a cell extract) and analysing the resultant metabolite. The cpd. is considered "safe" if it is not detoxified or is metabolised to a carcinogenic or "unsafe" if it is not detoxified or is metabolised to a carcinogenic cor "unsafe" if it is not detoxified or is sequence 1473 BP; 413 A: 345 C: 319 G: 396 T: 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
Novel method for the evaluation of the safety of a cpd. - using a human cytochrome P450 and yeast NADPH reductase to determine whether the analyte cpd. is detoxified or metabolised to a carcinogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human derived cytochrome; P4502C9; commercial cDNA library; yeast; transfection; recombinant production; expression vector; mammal; immunisation; sensitisation; antibody; determination; detection;

in purified from a host call culture using a combination of detergents and enzyme inhibitors. The method comprises (a) fractionating the host cells to prepare their membranes, (b) adding a non-ionic detergent to the membranes in a concentration of 0.8% (w/v) in a detergent: protein ratio of between 4:1 to 10:1, (c) adding an ionic detergent to the membranes in a concentration of 0.8% to 0.8% (w/v) in a detergent:protein ratio of between 7:1 to 4:1 (d) centrifying the membrane detergent mixture to remove insoluble materials and (e) membrane-detergent mixture to remove insoluble materials and (e) through a carboxymethyl-beaded column, then through a carboxymethyl-beaded column, and finally through a disthylaminoethyl-beaded column, then through a carboxymethyl-beaded column, and finally through a hydroxylapatite column. The method is used to purify cytochrome P450 proteins which are responsible for catalysing the oxidation of drugs, steroids, carcinogens and pesticides. The method simplifies the purification of P450 proteins, by the use of improved expression vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          126 cctagctctcaaaggtctatggccctgtgttcactctgtattttggcctgaaacccatag 185
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New P450 fusion proteins—comprising a portion of a bacterial sytochrome P450 protein and a portion of a mammalian sytochrome P450.
This invention describes a recombinant cytochrome P450 protein which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacterial; mammalian: cytochrome P450; chimeric; fusion protein; oxidise; hydrocarbon; carbon-hydrogen bond; hydroxylating; bioremediation; environmental pollutant; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                       21.9%; Score 163; DB 20; Length 1591; 97.1%; Pred.                                                                                                                                                                              The present sequence encodes the human derived cytochrome (HDC) P45029, which was obtd. from a commercial cDNA library. Yeast were transfected with an expression vector contg. the HDC cDNA. Library toultured and then disrupted to give a microsomal fraction. The HDC was purified from the fraction, and used to immunise and sensitise a mammal. Blood was drawn from the mammal, and an anti-HDC antibody isolated. The antibody obtd. recognises HDC P4502C9, partic. at a serum dilution rate of 1:10000, and is substantially without cross reaction to other HDC P450 spp..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..

```
The present invention describes a fusion proteins comprising a portion of a bacterial cytochrome P450 protein and also a portion of a mammalian cytochrome P450 protein. The fusion protein can oxidise hydrocarbons or any compound having a carbon-hydrogen bond. The fusion protein can be used for hydroxylating a compound to be oxidised. It can also be used in the bioremediation of an environmental pollutant. Since the fusion protein is soluble, it can be subject to structural elucidation by X-ray crystallography for designing functional proteins. It can be readily expressed in soil bacteria to facilitate bioremediation. The present sequence encodes mammalian cytochrome P450 protein CYP2C9 from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytochrome P450 2C19; human; liver; PCR; primer: detection: CYP2C19; stereospecific S-mephenytoin 4'-hydroxylase activity; polymorphism; ss.

The sequences given in AATI1378-81 encode allelic variants of cytochrome 450 209. The majority of clones isolated from liver S33 coded for 209. Of the 50 clones encoding 209, only two allelic variants were found. 39 cof the 209 clones were identical with clone 65, and 11 were identical cartial states were found. 39 cof the 209 clones were identical with clone 65, and 11 were identical cartial states of the 209 clones but contained 2 single base changes at positions 30 clone 25. Clone 25 and 62 single base changes at positions 20 clones 29c and 60 differ by one nuclectide in the coding region. The clones 29c and 60 differ by one nuclectide in the coding region clones 29c and 60 differ by one nuclectide in the coding region. The cartial state is a single amino acid change. The to Met at position 385. Clone 29c has a very long, 198 bp, 5'-noncoding region and a polyadenylation signal 21 bases from the poly-A tail. Clone 6b chas an unusually long 3'-noncoding region containing three possible color signals with no poly-A tail. The differences in the 3' con-coding regions could represent alternate splicing, allelic variants of 2018 because they differ by only one base in the coding region. They are most similar to 209 (82% amino acid homology).

                                                                                                                                                         This sequence encodes a human cytochrome P450 2C9 polypeptide isolated from clone 65. This polypeptide is used in a method to screen for a drug that is metabolised by a cytochrome P450 having S-mephenytoin 4'-hydroxylase activity. The protein can also be used to identify a mutagenic, carcinogenic or cytotoxic compound. Cytochrome P450 are a large family of hemoprotein enzymes capable of metabolising xenobiotics such as drugs carcinogens and environmental pollutants as well as endoblotics such as steroids, fatty acids and prostaglandins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Description
